

Forklift Fork Positioner

Fork Positioner for Forklifts - The fork positioner is actually a hydraulic device that can allow the driver to be able to work the lift truck without leaving the seat. They are constructed out of top quality materials and are meant to endure the most demanding operations and work environments. Side shifting units have the extra ability to be able to laterally position the entire load or the arms so as to facilitate more accurate lifting and placement in a faster and more efficient method.

The unique fork pocket design could enable operators to be able to securely swing the unit's forks without any worry of destroying the positioning cylinders. This allows the worker the alternative to either perform simultaneous or independent fork movement, dependent upon the requirements of the job. For most forklifts with non-OEM carriages, complete carriages are considered necessary. Standard OEM carriages can be converted into blade positioners on available units.
